

# **Appendix F**

## **Archeological Assessment Maps**

# Archeological Assessment Maps

The Archeological Assessment maps show areas of Archeological Potential (based on degree of development) and areas of Anticipated Deposits (where action occurred during the battle). The maps are split to focus on the north and south parts of the Project Area separately.

The maps are symbolized as follows:

## **Archeological Potential**

Green = High / Undeveloped or lightly developed land

Orange = Medium / Moderately developed land

Red = Low / Heavily developed land

## **Anticipated Deposits**

Cross-hatch Overlay = Major / Areas of battle engagement, encampment or prolonged activity

Slash Overlay = Some / Areas of brief activity

Dotted Overlay = Little / Areas of very brief activity or avenues of approach or egress

By juxtaposing the two metrics on one map we have found only one area to have high Archeological potential and major anticipated deposits (green cross-hatched areas) that could help planners and archaeologists determine the area most likely to contain artifacts. This area is within the Core Area and is on the south side of Boot Road, west of Ship Road.

The encampment areas on the north map contain some areas of high Archeological potential with *some* anticipated deposits.

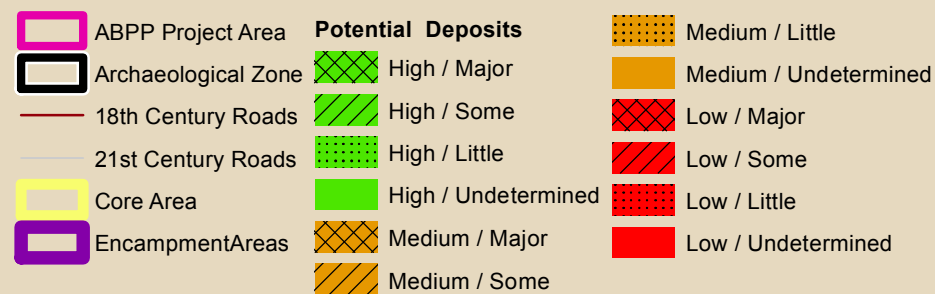

Due to the sensitive nature of archeological excavations, especially in residential areas, this map is not meant for public distribution. Anyone interested in this map should contact Chester County Planning or the PHMC.
